Opmerkingen:

- SPC Anandron: gebruik bij verminderde nierfunctie wordt niet vermeld.

Clcr < 10 ml/min:

-

MicroMedex 2009:

Only small amounts (less than 1%) of an oral dose of nilutamide is eliminated unchanged in the urine, and dose adjustments do not appear necessary in renal impairment (Creaven et al, 1991a). Although metabolites are excreted in the urine, they do not contribute significantly to pharmacologic effects.

Metabolites: numerous metabolites have been identified, including hydroxylated derivatives and secondary alcohols. However, none contribute significantly to antiandrogenic activity (Creaven et al, 1991; Pendyala et al, 1988).
